For example, conventional hardware-based protocols may require hardware changes to the networked computing environment and/or may rely on specific network protocols and/or other network components for specific hardware functionality. These limitations may result in significant delays for network communications and/or excessive overhead that can reduce the performance of the networked computing application. Overview In some embodiments, a client computer (which may also be referred to as a node, a peer, or a client node) can be a networked computing device that includes one or more components that may communicate with a server computer (which may also be referred to as a node, a peer, or a server node) over a network. In some of the embodiments, the client computer and the server computer can communicate over a serial line. This client computer and the server computer can communicate in the context of a networked computing environment where the server computer can provide components to the client computer (i.e., client-server interaction). In some embodiments, for example, the networked computing environment can include, for example, a networked computer system, a personal computer (PC), a workstation, a mobile device, a mobile phone, a wireless device, or another computing device. Examples of some of the various embodiments are described in the detailed description below. However, it will be appreciated that, in some cases, some embodiments can be combined, while in other cases, some elements may be omitted or changed.Q: How to make sure that checksum of a.net assembly is correct?
