phenotypic switch in HSV-1 gene transcription and  
replication induced by altering the expression of the  
ICP4 gene product. The immediate-early (IE) gene  
products of herpes simplex virus (HSV) stimulate  
transcription and replication of all HSV genomes as  
part of the transcriptional activation process. The  
products of four IE genes, ICP4, ICP22, ICP47 and  
ICP27, have been shown to cooperate in a  
transcriptional activation process. There are two copies

---

of the ICP4 gene in HSV-1 and the copy in the variant strain F is truncated. Expression of ICP4 in HSV-1 strain 17 has been shown to influence IE gene transcription and replication, but no studies have previously been carried out to show whether this occurs in the other copy of the gene or whether it influences the replication of genomes from which the gene has been deleted. In this study, expression of the ICP4 gene in strain 17 was switched off by deleting its promoter, and expression of the truncated ICP4 in F was switched on by placing a strong promoter upstream of the truncated gene. The resulting double mutants were investigated for expression of
