Photoshop offers three different views of your work when you're editing an image: the Image Viewer (it's on the View menu), the Photoshop Editor (not available in the View menu), and the Photoshop Preview window (available on the View menu). The difference between these three views is not all that great. The Image Viewer is primarily what you see, and it isn't as important as the editing. The editor displays the layers. In the preview window, you can see which layers are visible and which are hidden. In the editor, you have more tools to see how your edits work in real time, whereas in the viewer, you merely see the result. To view and edit your work, choose View→Image Viewer, or simply double-click on the image thumbnail in the left window and then choose Image Viewer from the menu that appears. If you're about to make an adjustment that requires lots of images to be loaded into memory, do it on a new, empty Photoshop document and then exit Image Viewer before you start to edit, if that's what you're after. Figure 5-1 provides a short overview of the Photoshop interface, where you can find the options that you need. See this chapter's later sections for more about the different features available to you. **Figure 5-1:** The options and controls are easy to use, and they run on a wide range of computer platforms. You can use the full professional version of Photoshop for incredible levels of editing prowess, but the free version still provides many useful tools, and it's available on a variety of platforms, including Mac, Windows, and Linux, so you have a great deal of flexibility in how you work. Setting the Work Environment Setting the work environment for Photoshop is a little different than if you're working in another graphics program. The first thing you must do is create a new Photoshop document if you haven't already done so. Double-click on the canvas to open a blank document. I often just create a new Photoshop document when I'm working on a new project. It's great to have a single document for use in multiple projects. However, you can also open a new document and then open an image that you already have saved in Photoshop from the Windows Explorer (or Linux) window. (If you don't know how to do this, see Chapter 12.) After you create a new document and open one or more images, you can switch

New Teaching Scale for Basic Life Support in Healthcare Institutions in the Republic of Korea. The basic life support (BLS) of healthcare institutions is important for the improvement of early response to patients with cardiopulmonary resuscitation (CPR), the early recognition of life-threatening conditions, and the care of patients with life-threatening conditions. In order to improve the quality of BLS education, the Korean Resuscitation Council (KRC), which is the national body for early response and CPR programs, sought to develop a new teaching scale for BLS in healthcare institutions in the Republic of Korea. The BLS-Teaching Scales for Healthcare Institutions that were developed by the KRC were used to survey BLS education for healthcare professionals in healthcare institutions in the Republic of Korea. Through this, the usage of BLS-Teaching Scales for Healthcare Institutions was evaluated for curriculums and teaching methods, and the results of the survey were used to formulate BLS curriculums for healthcare professionals in healthcare institutions. In order to develop new educational methods, education on high-quality CPR and effective BLS was accomplished, and the education of basic healthcare and critical care was improved by the teaching results. The new BLS curriculums for healthcare institutions were revised and implemented based on the education results. The development and revision of new BLS curriculums for healthcare institutions through evaluation of the BLS-Teaching Scales for Healthcare Institutions are necessary to improve basic healthcare education for healthcare professionals in healthcare institutions. Granulocyte colony-stimulating factor as a single agent for induction of profound remission in patients with acute myelogenous leukemia in remission. We studied a group of 21 patients with AML in first or second remission treated with a single-agent schedule of recombinant human granulocyte colony-stimulating factor (rhG-CSF). rhG-CSF was administered to nine patients with chronic myelogenous leukemia (CML) in chronic phase (CP) (median age: 46 years) and ten patients with AML (median age: 50 years). All patients received subcutaneous doses of rhG-CSF at 3 micrograms/kg/day (6 micrograms/kg/day if > or = 75 years of age). One patient with CML-CP died of infection at day 11 of therapy. Among 19 patients evaluable for response, there was one CR, three PR, one minor CR, and seven no change (NC)
