## Z Scope Secure Tunnel Crack

### What's New In?

The secure tunnel is essentially a client to server secure connection. In other words, the SCOPE tunnel will make your Internet or Intranet connections through a trusted system or a firewall. Problem: It seems that it is no possible to get it working on the server. The system tells me that "No scope allowed to connect". As I've found, the only supported version is "BASIC", then I've tested a http-s connection and finally I found that the system needs to have a "Tunnel Type" "Host" (true) and a "Stream" (true). Setting a ""Tunnel Type""=t, then a ""Host""="[mydomain]" and "Stream"="1" to "true" will allow the connection and the system will return all the information that are available. So the "tunnel" type is must because the connection must be "forwarded" to the mainframe by the server. The system then will use the "Host" to find the "Scope". The scope name that the system is going to use is mandatory. For a more information about Scope can be found in the section of "IBM z/OS Client Access". So the problem of the system is to know the scope name. Solution: As it seems that it is no possible to find a "scope name" for the "BASIC" version, I've tried to start a "reflection" application that return all the available scopes and the one that I've chooseed to "connect" is the "foster" scope name. (It's different of the "foster" which is the name of the "scope" that I've use in the "tunnel" type (t) and the one in the "host" (mydomain). I've test it with my client (ssh) and with the webui that I've use to connect. It doesn't work but with the "Host" value that is mandatory to get the connection. So in the "stream" value you must put "1" to "true". And for the "tunnel type" you must put "t". After the setting is done, to connect to the "Mainframe" the name of the scope is mandatory. There is nothing that the system is going to do for you. For more information about the "tunnel type" can be found in the section of "IBM z/OS Client Access". Unrelated information: The "foster" scope name used in the "tunnel" type (t) and "Host" value must match the scope name of the mainframe. It's not a value that the system is going to set for you. Test results: It works with the following tunnel and stream combination. "

---

## System Requirements For Z Scope Secure Tunnel:

Supported OS: OS X 10.9.2 or later CPU: 3 GHz Intel Core 2 Duo Memory: 4 GB RAM Storage: 5 GB available space Video: 2GB AMD Radeon HD 6700 series, 2GB Intel HD Graphics 4000, or equivalent Internet: Broadband Internet connection  
Screenshots: This list contains web games, also called web-based games. These games do not have a download function, but they run directly from the browser. 1.
