Colorectal anastomosis healing is a complex process which has been regarded as the main cause of anastomotic leak and subsequent complications. Research in recent years has focused on seeking for alternative and more effective therapies for the prevention of infection and wound healing after colorectal surgery. In this study we aimed to investigate the effects of ciprofloxacin administration on intestinal anastomotic healing in rats. Fifty-four male Wistar albino rats were used for the study. Anastomosis was performed in the cecum. Ciprofloxacin was injected intraperitoneally in one group (group 1) for a 7-day period, and the other group (group 2) was used as the control. Specimens were obtained on the seventh and 14th day of anastomosis for microbiological and morphometric study. In group 1, there was positive culture in 10 of 15 rats on the 7th day, and in two of 15 rats on the 14th day. In group 2, there was positive culture in 15 of 15 rats on the 7th day and in 15 of 15 rats on the 14th day. There was no significant difference between the groups in terms of the positive culture results. There was a statistically significant difference between the groups in terms of anastomotic bursting pressure and histopathologic grading scores. There was a significant difference between the groups in terms of anastomotic wall thickness in both the 7th and 14th days (P Quantitative phenotyping of Aspergillus fumigatus by image analysis of colony growth under dynamic light conditions. We examined whether data obtained by measuring fungal growth could be used for automated analysis of important disease-relevant phenotypes of Aspergillus fumigatus, e.g., biofilm formation. Colony diameter under dynamic light conditions (DC+ L) and colony-diameter after 48
